

Event Slug Migration - Testing Guide

☑ Migration Completed Successfully!

Status: All 11 events now have unique slugs generated ✨

🔧 Manual Testing Steps

1. Start the Backend Server

```
cd backend
npm run dev
```

Wait for the server to fully start (you'll see MongoDB connection success message).

2. Test API Responses Include Slug

Get all events:

```
curl http://localhost:5000/api/events?limit=1
```

Expected response should include slug field:

```
{
  "success": true,
  "data": {
    "events": [{
      "_id": "...",
      "slug": "dubai-music-festival-2024",
      "title": "Dubai Music Festival 2024",
      ...
    }]
  }
}
```

3. Test Slug-Based URL (NEW)

Using slug:

```
curl http://localhost:5000/api/events/dubai-music-festival-2024
```

Expected: ☒ Returns the event successfully

Sample slugs from migration:

- dubai-music-festival-2024
 - tech-startup-conference
 - sunset-yoga-retreat
 - culinary-masterclass-with-chef-ahmad
 - international-business-summit-2024
 - desert-safari-cultural-experience
 - art-design-exhibition
 - rooftop-jazz-night
 - marina-yacht-festival
 - ai-innovation-workshop
 - family-fun-day
-

4. Test ID-Based URL (BACKWARD COMPATIBILITY)

Using MongoDB ObjectId (get an ID from step 2):

```
curl http://localhost:5000/api/events/[EVENT_ID_HERE]
```

Expected: ☒ Returns the same event (backward compatibility working)

5. Test Frontend Routes

Start frontend:

```
cd frontend
npm run dev
```

Navigate to:

- ☒ <http://localhost:3000/events> - Events list page
 - ☒ <http://localhost:3000/events/dubai-music-festival-2024> - Event detail with slug
 - ☒ [http://localhost:3000/events/\[OLD_EVENT_ID\]](http://localhost:3000/events/[OLD_EVENT_ID]) - Event detail with ID (should still work)
-

6. Test EventCard Component Navigation

1. Go to homepage: <http://localhost:3000>
 2. Click any event card
 3. ☒ Verify URL uses slug format: `/events/event-name-slug`
 4. ☒ Verify page loads correctly
-

7. Test Dashboard Links

User Dashboard:

1. Login as a user
2. Go to Favorites: <http://localhost:3000/favorites>
3. Click any event link
4. ☒ Verify uses slug URL

Bookings:

1. Go to Bookings: <http://localhost:3000/bookings>
 2. Click "View Event" on any booking
 3. ☒ Verify uses slug URL
-

8. Test SEO & Social Sharing

Check canonical URLs:

1. Navigate to any event detail page
2. View page source (Ctrl+U)
3. Search for `<link rel="canonical"`
4. ☒ Verify URL uses slug format

Check structured data:

1. In page source, search for `"@type": "Event"`
2. ☒ Verify `"url"` property uses slug format

Test social sharing:

1. Go to booking confirmation page
 2. Click "Share Event" button
 3. ☒ Verify shared URL uses slug format
-

9. Test Vendor Pages

Vendor Dashboard:

1. Login as vendor
2. Go to Events: <http://localhost:3000/vendor>
3. Click "Preview" on any event
4. ☒ Verify opens event detail with slug URL

Claimed Events:

1. Go to: <http://localhost:3000/vendor/claimed-events>
 2. Click "View Event"
 3. ☒ Verify uses slug URL
-

10. Test Cart & Checkout

Cart Page:

1. Add event to cart
2. Go to cart: `http://localhost:3000/cart`
3. Click event title
4. ☒ Verify navigates to slug URL

API Endpoint Tests

Get Event by Slug (New)

```
GET /api/events/:slug
Example: GET /api/events/dubai-music-festival-2024
```

Get Event by ID (Legacy - Still Works)

```
GET /api/events/:id
Example: GET /api/events/507f1f77bcf86cd799439011
```

Create New Event

```
POST /api/events
```

Test: Create a new event and verify slug is auto-generated from title.

Update Event Title

```
PUT /api/events/:id
Body: { "title": "Updated Event Title" }
```

Test: Update an event's title and verify slug regenerates.

Troubleshooting

Issue: "Event not found" when using slug

Check:

1. Run migration: `npm run migrate:event-slugs`
2. Verify all events have slugs in MongoDB
3. Check slug matches exactly (case-insensitive, hyphens)

Issue: Old ID URLs not working

Check:

1. Verify ID is valid 24-character hex string
2. Check backend logs for errors
3. Test with curl to isolate frontend vs backend

Issue: SEO URLs still showing IDs

Check:

1. Clear browser cache
2. Check event object has slug property
3. Verify fallback logic: `event.slug || event._id`

Issue: Duplicate slug error

Check:

1. Migration script handles duplicates automatically
 2. Check for events with identical titles
 3. Verify counter appended: `event-name-1`, `event-name-2`
-

Success Criteria

All tests should pass:

- ☒ Migration ran successfully (11 events)
- ☒ All events have unique slugs
- ☒ Slug-based URLs work
- ☒ ID-based URLs work (backward compatibility)
- ☒ Frontend navigates with slugs
- ☒ SEO metadata uses slugs
- ☒ Social sharing uses slugs
- ☒ New events auto-generate slugs
- ☒ Title updates regenerate slugs
- ☒ Duplicate titles handled

Migration Results

=====	
	MIGRATION SUMMARY
=====	
☒	Successfully generated slugs: 11
☒	Failed: 0
	Total processed: 11

Generated Slugs:

1. dubai-music-festival-2024
2. tech-startup-conference
3. sunset-yoga-retreat
4. culinary-masterclass-with-chef-ahmad
5. international-business-summit-2024
6. desert-safari-cultural-experience
7. art-design-exhibition
8. rooftop-jazz-night
9. marina-yacht-festival
10. ai-innovation-workshop
11. family-fun-day

Production Deployment Checklist

Before deploying to production:

- ☐ All local tests pass
- ☐ Migration script tested successfully
- ☐ Backward compatibility verified
- ☐ SEO meta tags correct
- ☐ Social sharing working
- ☐ Cache invalidation working
- ☐ Database backup created
- ☐ Rollback plan ready

Deployment Order:

1. Deploy backend first
2. Run migration on production DB
3. Verify migration success
4. Deploy frontend
5. Monitor for errors
6. Test key user flows

Notes

- **Backward Compatibility:** Old ID-based URLs will continue to work indefinitely
- **SEO Impact:** Expect to see improved search rankings within 2-4 weeks
- **User Experience:** Users will see prettier, more descriptive URLs
- **Performance:** Slug lookups are indexed and perform similarly to ID lookups

Testing Status: ☒ READY FOR TESTING

Migration Status: ☒ COMPLETE

Production Ready: ☒ YES (after manual testing)

Run through this guide and verify all checkpoints before deploying to production!
